**Big Picture – CPU, Memory, and Pages:** 

# **Page Eviction/Replacement Strategies:**

When we need to remove a page from RAM and store it on disk, how do we decide which page to remove given a **page access pattern**?

Strategy #1:

|        | 17 | 33 | 40 | 17 | 43 | 8 | 99 | 33 | 99 | 17 |
|--------|----|----|----|----|----|---|----|----|----|----|
| 9      |    |    |    |    |    |   |    |    |    |    |
| R      |    |    |    |    |    |   |    |    |    |    |
| A<br>M |    |    |    |    |    |   |    |    |    |    |
| 141    |    |    |    |    |    |   |    |    |    |    |

Strategy #2:

|        | 17 | 33 | 40 | 17 | 43 | 8 | 99 | 33 | 99 | 17 |
|--------|----|----|----|----|----|---|----|----|----|----|
| 1      |    |    |    |    |    |   |    |    |    |    |
| R      |    |    |    |    |    |   |    |    |    |    |
| A<br>M |    |    |    |    |    |   |    |    |    |    |
| 141    |    |    |    |    |    |   |    |    |    |    |

Strategy #3:

|        | 17 | 33 | 40 | 17 | 43 | 8 | 99 | 33 | 99 | 17 |
|--------|----|----|----|----|----|---|----|----|----|----|
| D      |    |    |    |    |    |   |    |    |    |    |
| R<br>A |    |    |    |    |    |   |    |    |    |    |
| M      |    |    |    |    |    |   |    |    |    |    |
|        |    |    |    |    |    |   |    |    |    |    |

Strategy #4:

|             | 17 | 33 | 40 | 17 | 43 | 8 | 99 | 33 | 99 | 17 |
|-------------|----|----|----|----|----|---|----|----|----|----|
| R<br>A<br>M |    |    |    |    |    |   |    |    |    |    |
|             |    |    |    |    |    |   |    |    |    |    |

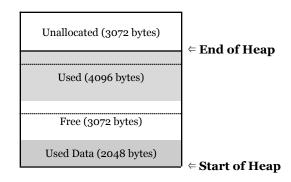

Other Strategies:

## **Fragmentation**

As we develop various systems for storage, we want to minimize **fragmentation**.

- [Fragmentation]:
- [Internal Fragmentation]:
- [External Fragmentation]:

# **Fragmentation Example in Heap Memory:**

#### **Computer Peripherals**

- Every other piece of hardware we consider to be a "peripheral".
- Interface managed by the \_\_\_\_\_.
  - ...and managed using \_\_\_\_\_.
- Examples:

Threads: The Unit of Computation in an Operating System As a programmer, the single most important construct in an Operating System is a thread.

- Every thread has a **program counter**, a pointer that stores the next instruction to be read by a program.
- A \_\_\_\_\_\_ is an organization of one or more threads in the same context. A simple process has only one thread.
- In C, the initial thread is called the \_\_\_\_\_\_
  It is what starts running your main() function!

## **Creating Additional Threads in C**

The pthread library is the POSIX thread library allowing you to create additional threads beyond the main thread.

Creating a new thread is a complex call with four arguments:

```
int pthread_create(
                     /* thread struct */
 pthread_t *thread,
 void *(*start_routine) (void *), /* start func
             /* thread start arg */
 void *arg
```

The start\_routine has a very interesting type signature:

```
void *(*start_routine) (void *)
```

This signature is a **function pointer** ("functor") and is the syntax we can use to pass a pointer to a function. Therefore, the third argument into pthread\_create must be a function with the following prototype:

```
void *_____(void *ptr);
```

...you can use any name for the function name.

**Example: Launching Fifteen Threads** 

```
07/fifteen-threads.c
   #include <pthread.h>
   const int num_threads = 15;
   void *thread_start(void *ptr) {
     int id = *((int *)ptr);
     printf("Thread %d running...\n", id);
     return NULL:
10
11
12
   int main(int argc, char *argv[]) {
14
     // Create threads:
15
     pthread_t tid[num_threads];
16
     for (i = 0; i < num_threads; i++) {</pre>
17
       pthread_create(&tid[i], NULL,
18
                                   thread_start, (void *)&i);
19
20
21
     printf("Done!\n");
22
      return 0;
23 }
```

**Q1:** What is the expected output of this program?

**Q2:** What actually happens?

**Q3:** What do we know about threads in C?
